

Recuperación del lenguaje y funciones cognitivas tras un ictus: un estudio longitudinal

Simona Mancini, PhD
Neurolinguistics and Aphasia Group

Basque Center on Cognition Brain and Language (BCBL)

Karen Arellano, Nerea Gorostiola, David Soto (BCBL)
María del Mar Freijo Guerrero (IIS Biocruces Bizkaia)

Relation between:

- * **Language comprehension and production:**
 - * How words are combined into sentences: grammar/syntax
 - * The meaning of words and sentences: semantics
 - * The sound of words and sentences: phonology/prosody
- * **Domain-general cognitive functions:**
 - * Selection and control of sensory information: Attention
 - * How we maintain and manipulate information: Memory
 - * Logic problem solving: Reasoning

Relation between language and DG abilities post stroke:

Variability

1) **Diverse post-stroke time of participants**

2) **Scope of language abilities tested:** either overall language abilities (“*aphasia quotient*”) or one single ability (“*naming*”)

3) **Type of tasks/instructions:** verbal output and comprehension of complex instructions are expected in DG tests

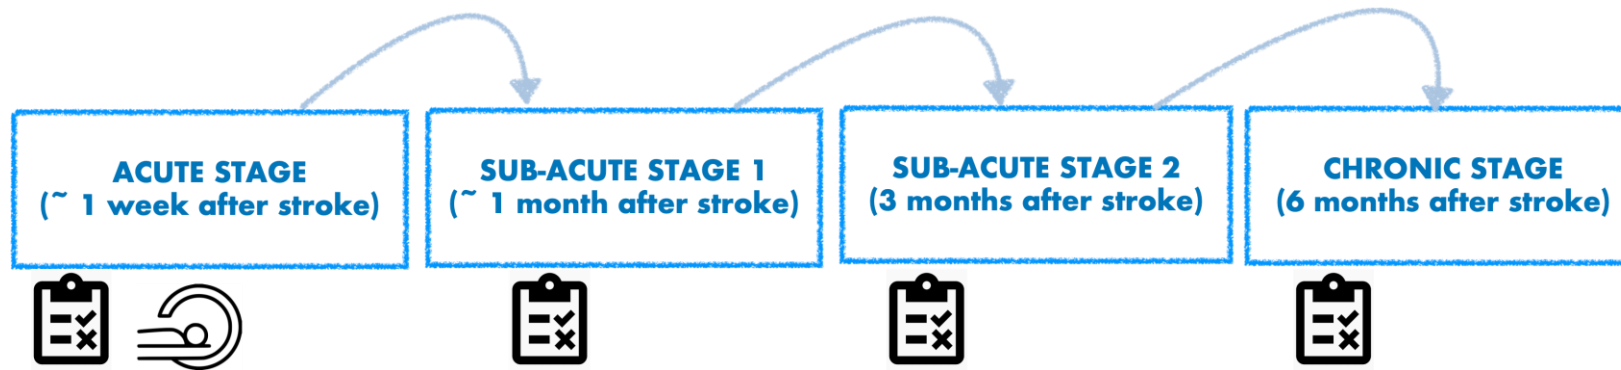

The current study

What is the relation between DG and linguistic functions during recovery from stroke?

- * **Stable?** Language ~ DG functions at all times
- * **Dynamic?** Language ~ DG functions at some but not all stages of recovery
- * **Is it the same across linguistic domains?**

Relevance for the design of therapeutical plans

The current study

- **Inclusion criteria:**

- LH or RH stroke
- First ischemic stroke (left or right hemisphere)
- Native Spanish speaker

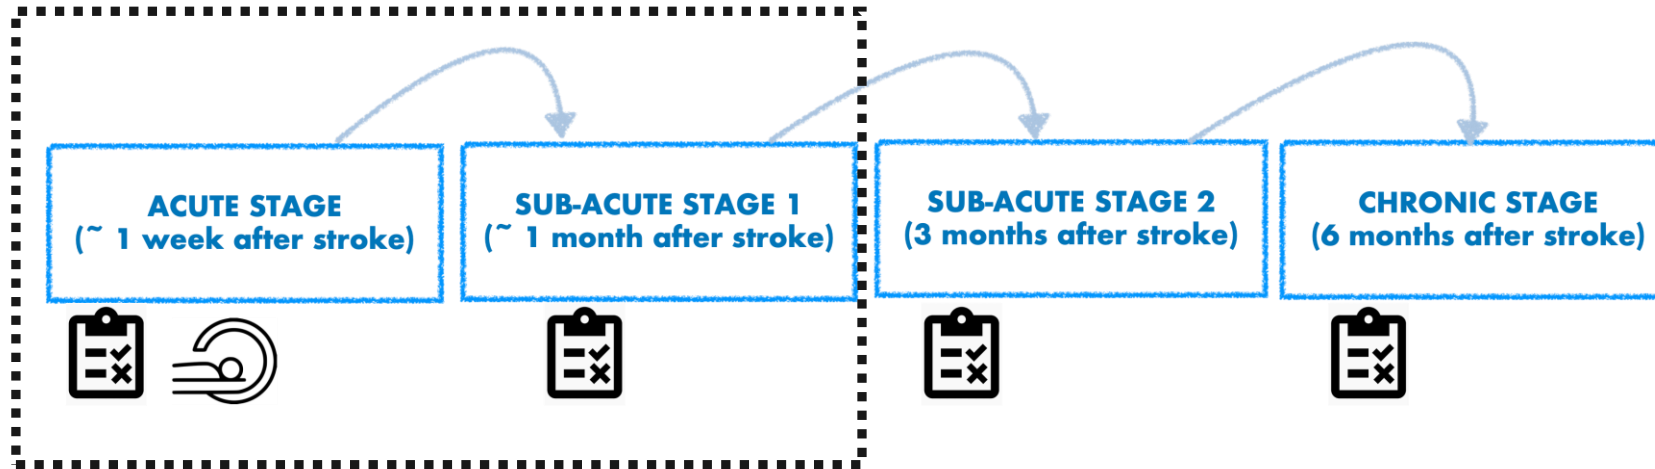

- **Exclusion criteria:**

- Any cognitive impairment before the event
- Previous stroke
- Severe aphasia, motor, hearing or visual deficits

90+ patients tested so far (LH + RH)

- 14 complete follow-ups
- Control group (non-brain damaged participants)

The current study: Today

17 LH, 16 RH

- Comprehension / Production
- Attention network

Methods: attention network task (ANT)

Material

Cue vs.no-cue → ALERTING NETWORK

Orienting vs. non-orienting cues → ORIENTING NETWORK

CONFLICT/EXECUTIVE ATTENTION NETWORK

Congruent trials:

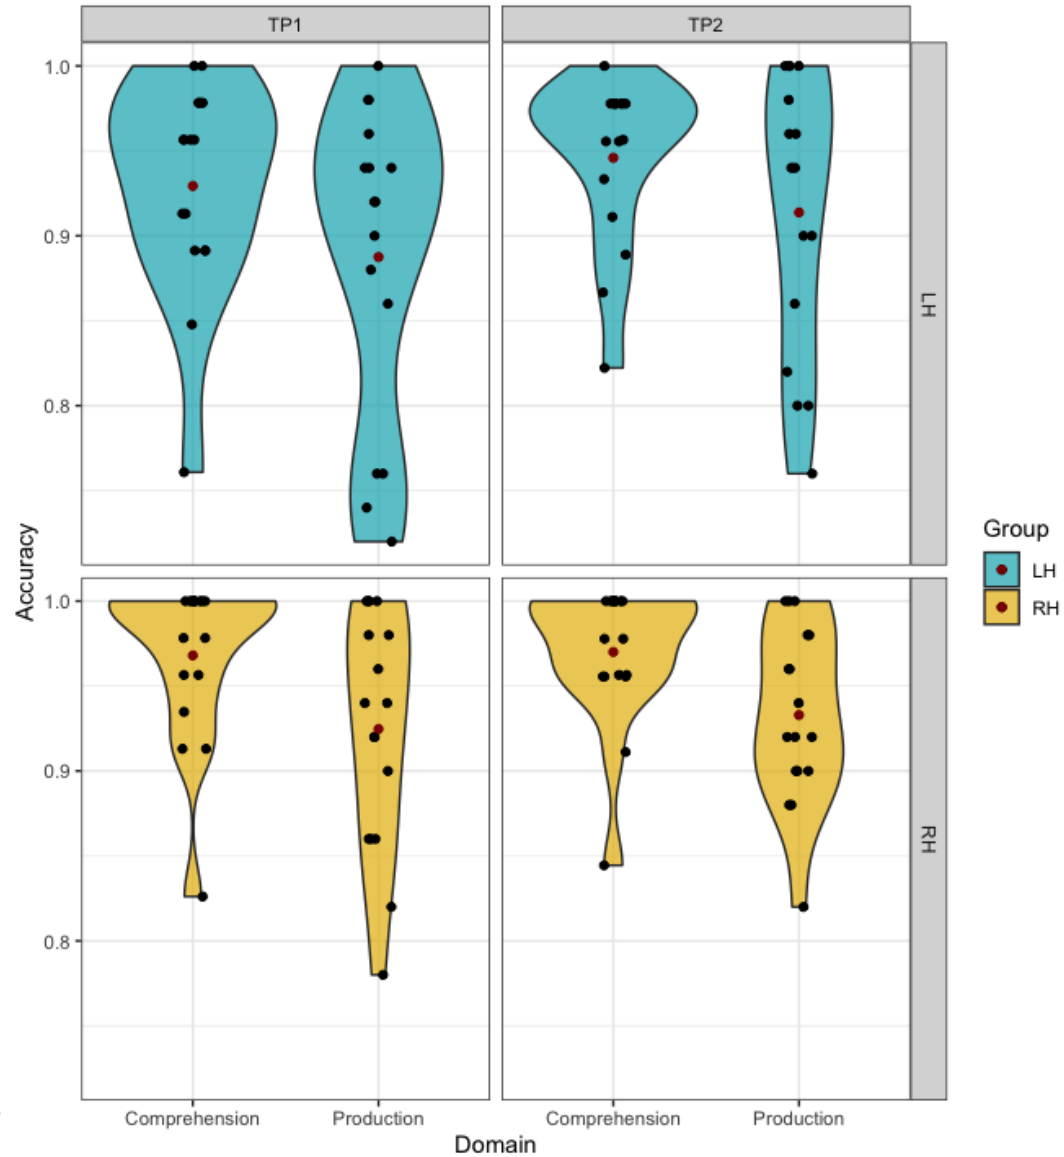

Incongruent trials

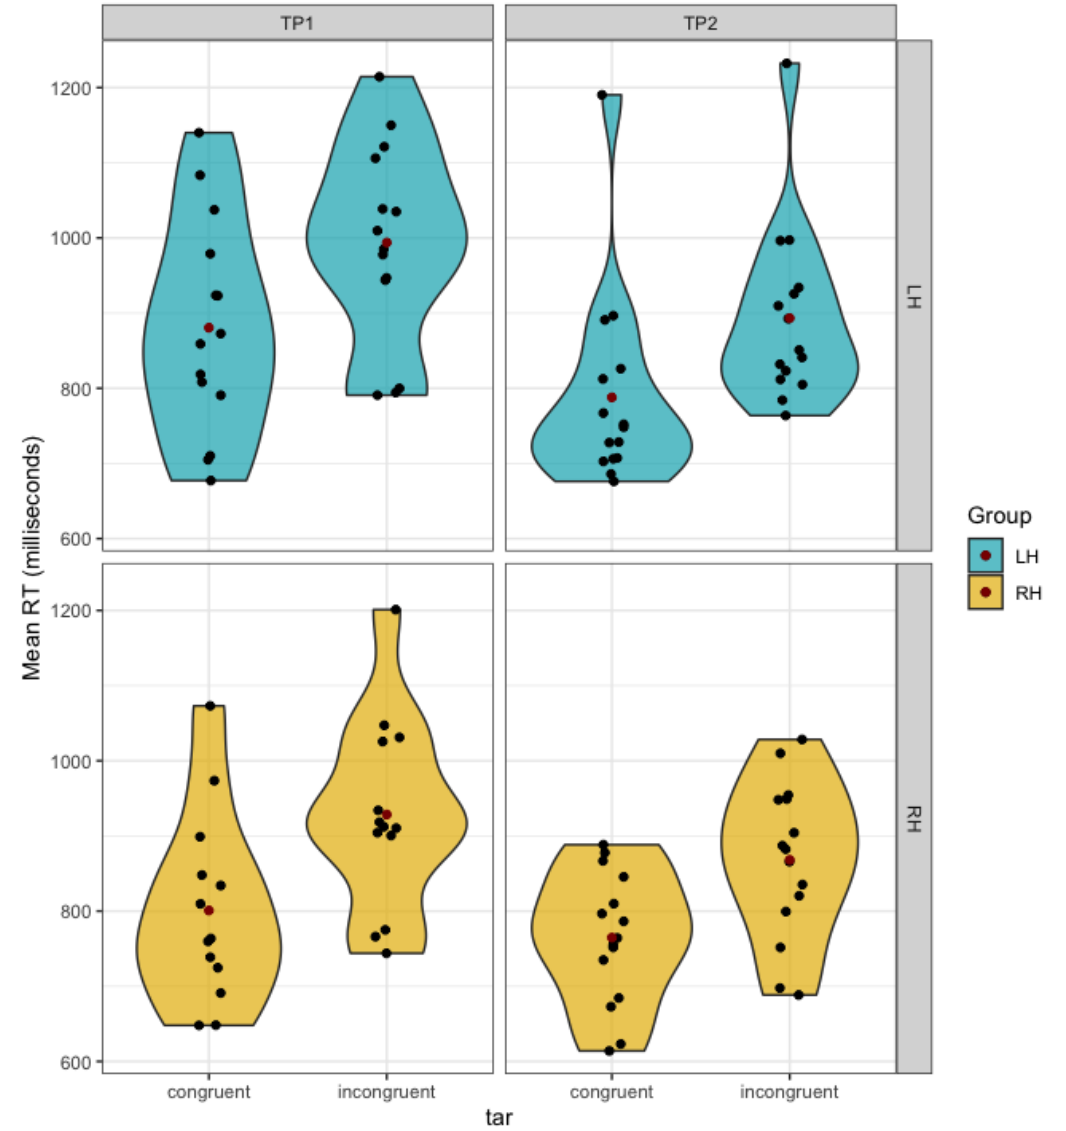

Results: overall performance

Language comprehension and production performance

ANT: Performance on congruent and incongruent trials

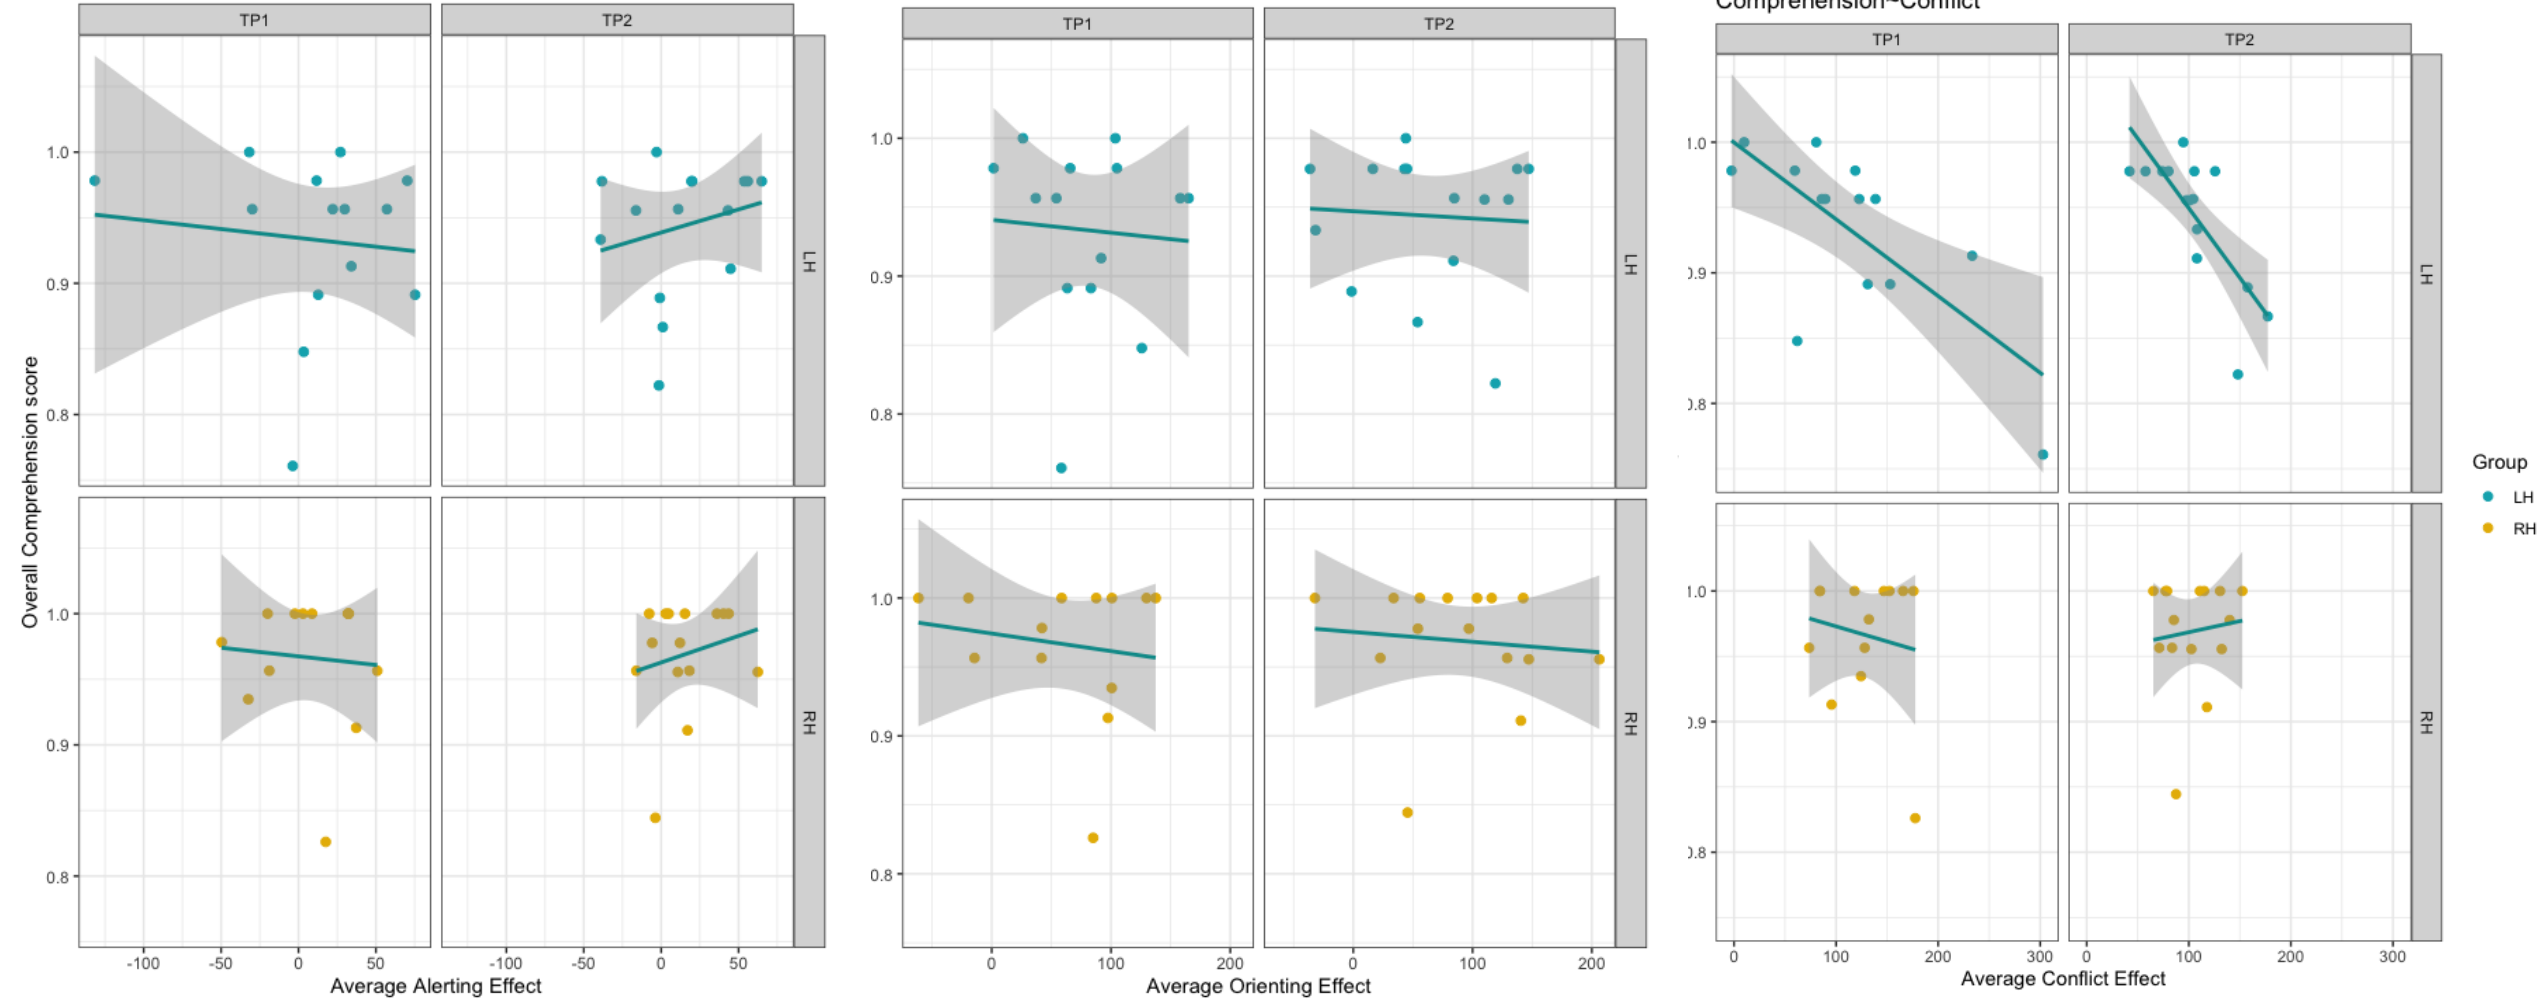

Results: comprehension and attention network

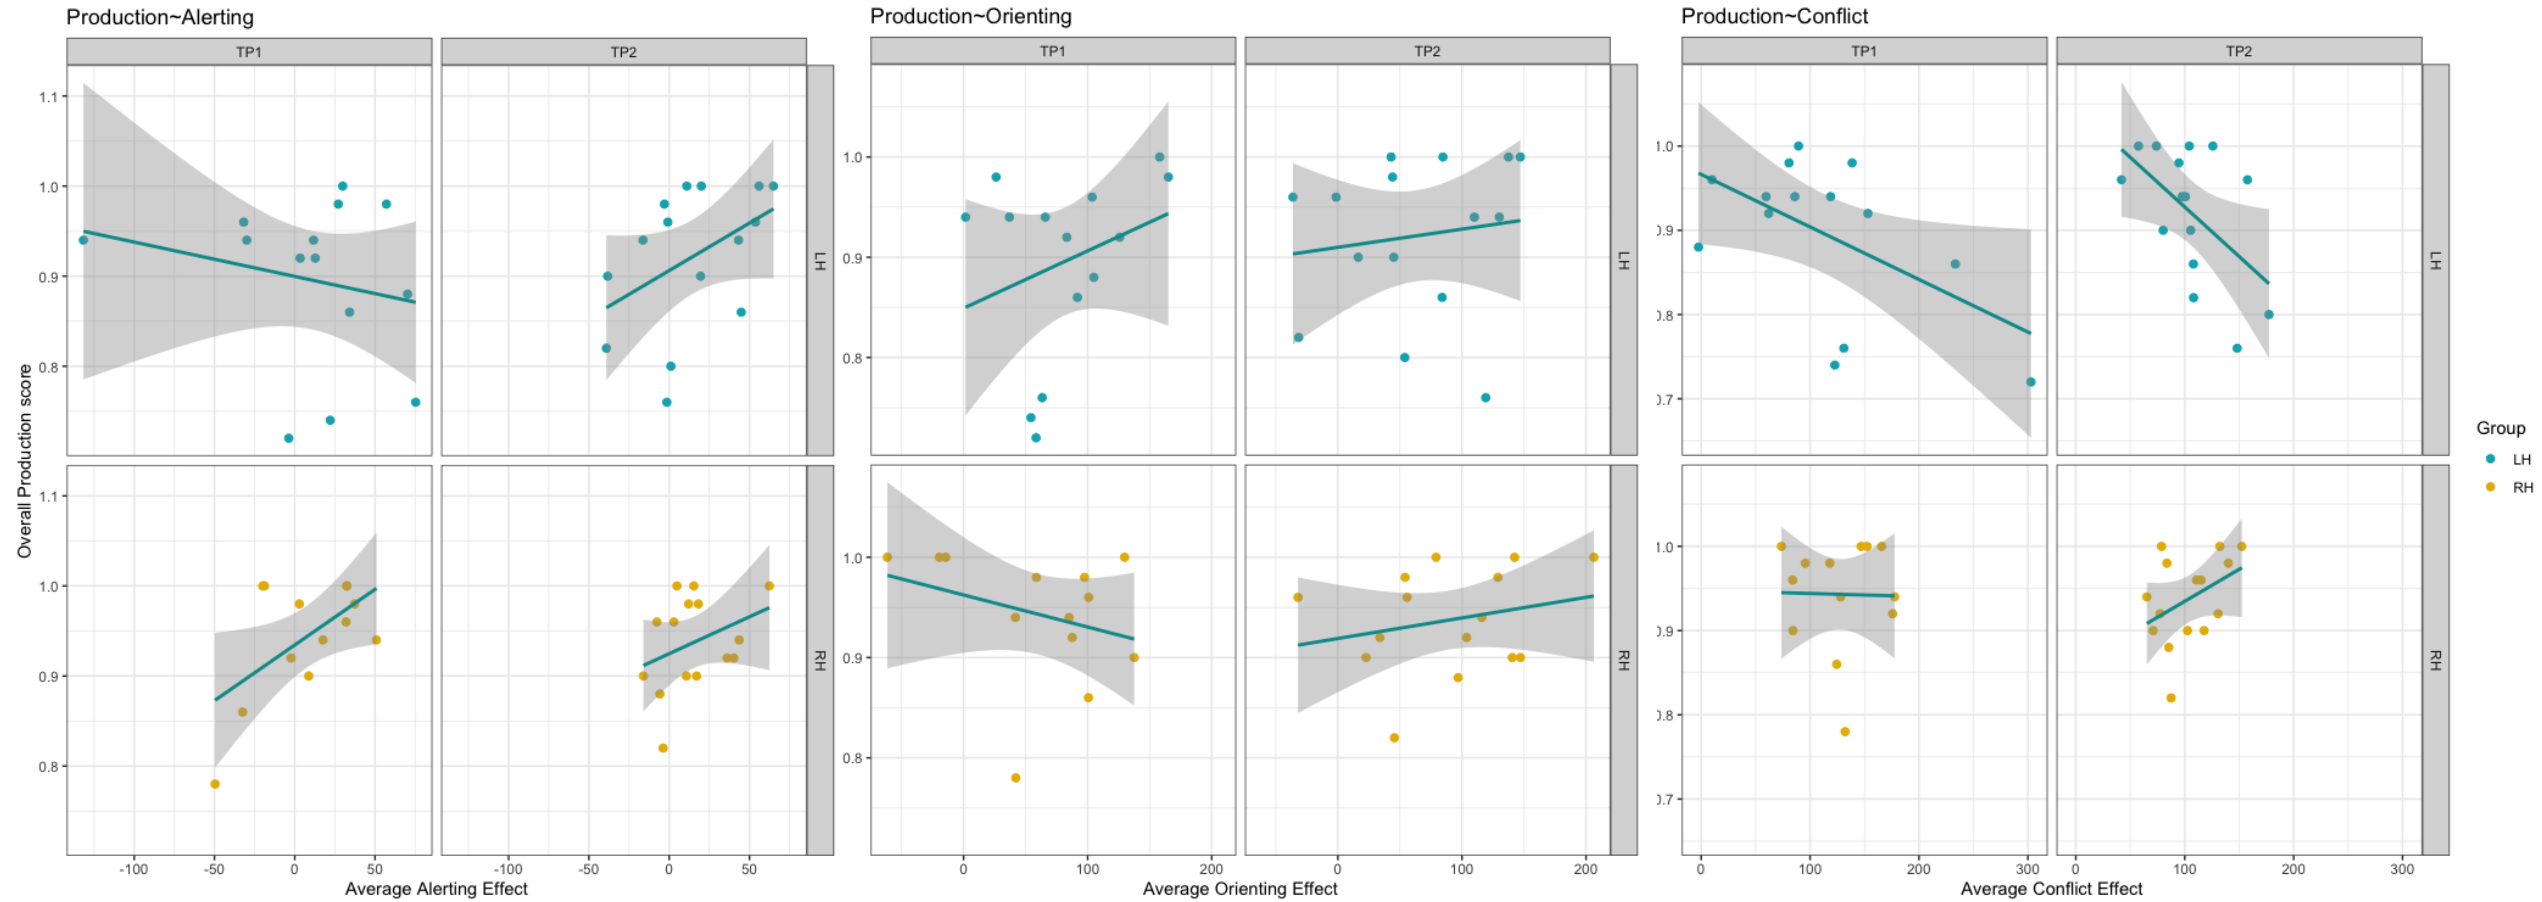

Comprehension~Alerting

Comprehension~Orienting

Comprehension~Conflict

Results: production and attention

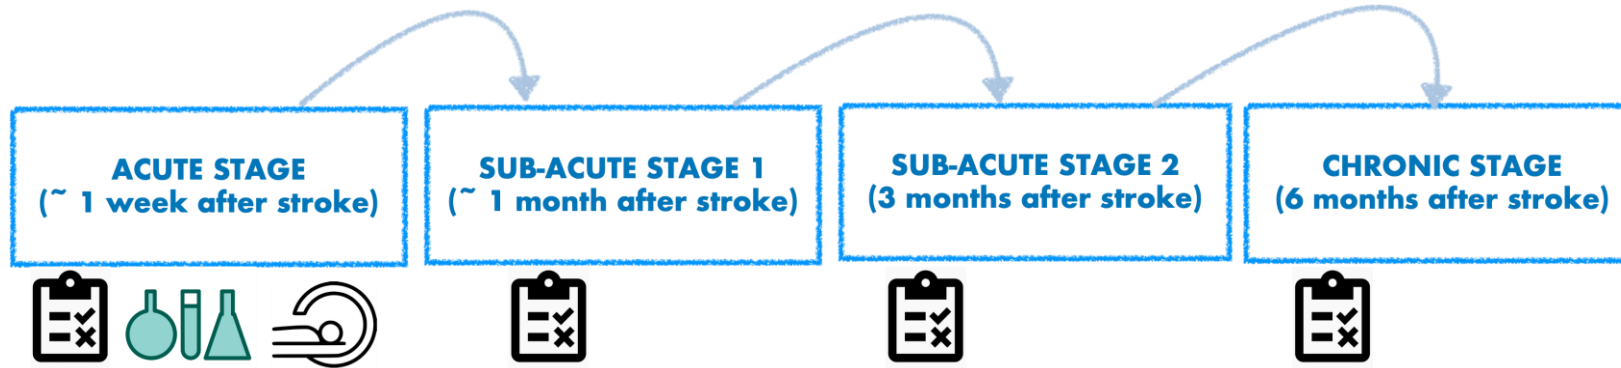

During the 1st month post stroke:

- * Both language comprehension and production are associated with **executive control functions**, especially after LH damage:
 - * Targeting executive control during therapy at early stages can enhance linguistic performance?

Limitations and future directions

- * Small sample of LH patients with mild or no aphasia
- * More information from testing at successive TPS (from 3 months post stroke) & DG functions
- * Test association between attention network and spontaneous speech

Future directions

Role of molecular biomarkers and blood-brain barrier disruption in predicting language and cognitive impairment

With Abraham Martín (Achucarro) & Pedro Ramos (CIC biomaGUNE)

¡Gracias!

BASQUE CENTER
ON COGNITION, BRAIN
AND LANGUAGE

Relation between language and DG abilities:

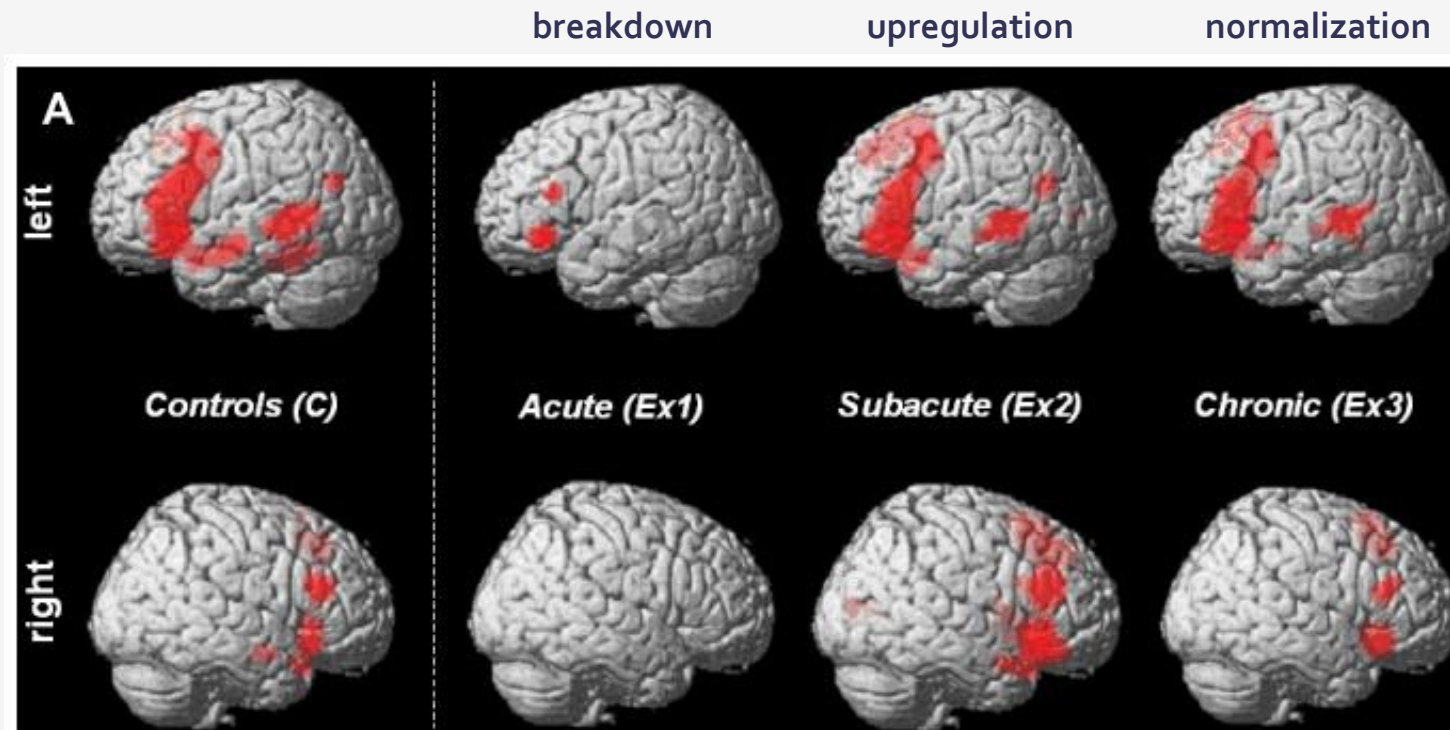

Controversial evidence:

- * Language **highly reliant** on DG mechanisms during language production but not comprehension
- * Core linguistic functions (syntax) are **independent** from DG mechanisms

(Campbell et al. 2016; Diacheck et al. 2020 Fedorenko, 2014; Fedorenko & Thompson-Schill, 2014; Gerenmayeh et al. 2012, 2014)

Relation between language and DG abilities post stroke:

Dynamics of language reorganization over time

Impact of domain-general functions over linguistic functions during recovery might be **dynamic**.

(Saur et al., 2006)

Introduction

2) Scope of language abilities tested

Overall scores on language based on:

- Comprehensive Aphasia Test (CAT)
- Western Aphasia Battery (WAB)

Missing assessment of comprehension and production in each linguistic level.

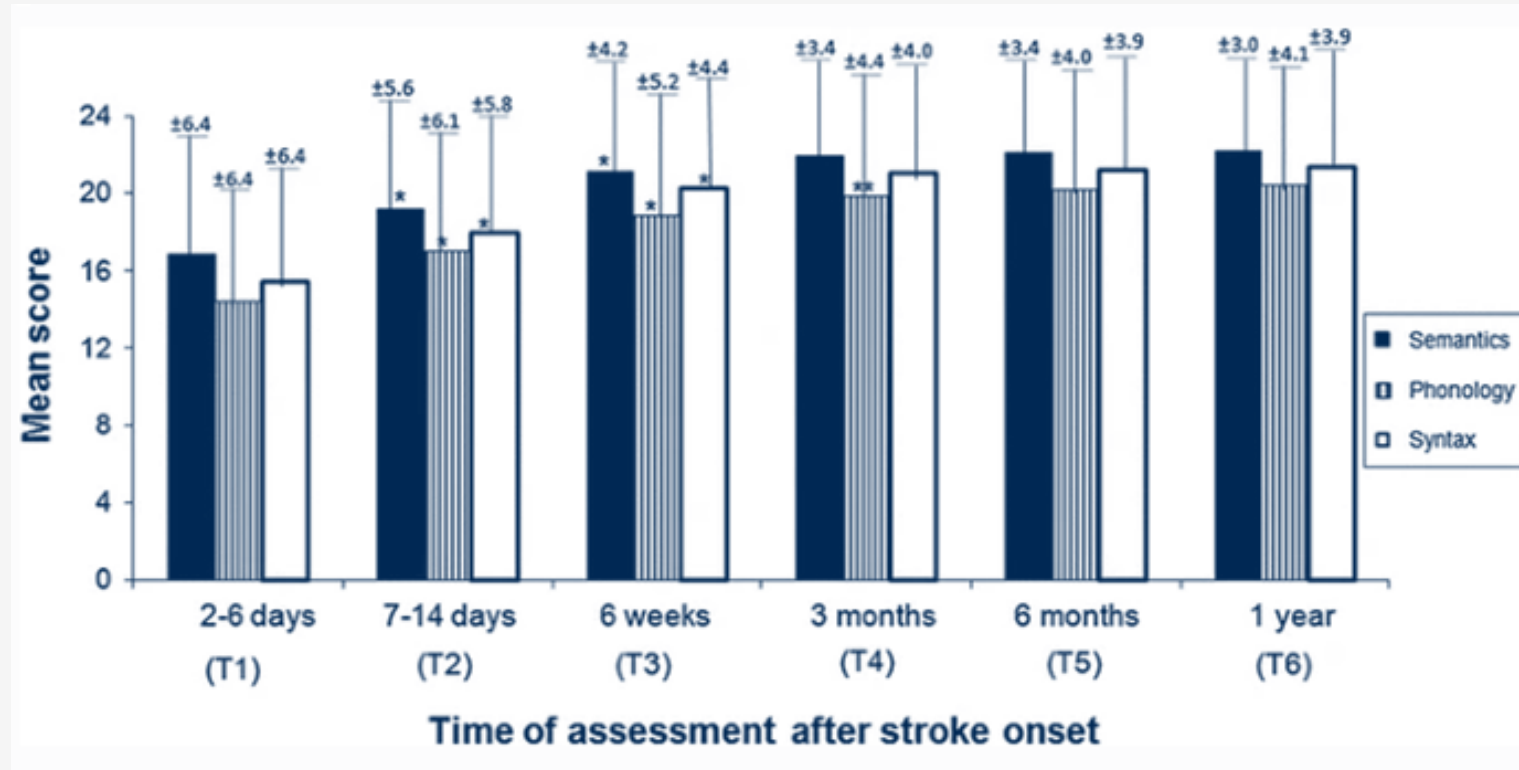

Narrow scope:

- Boston Naming Test

(e.g. Fucetola et al. 2009; Wall et al., 2017, Gonzalez et al., 2020, El Hachoui, 2013)

Introduction

2) Scope of language abilities tested

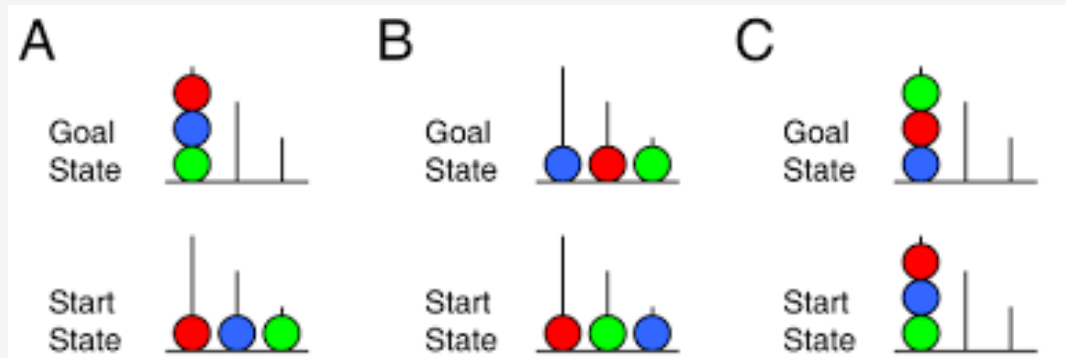

Linguistic levels may **differ** with respect to their underlying mechanisms and recovery rate

Introduction

3) Verbal output and comprehension of complex instructions expected in DG tests

- Brixton Spatial Anticipation Test
- Tower of London Test

Linguistic impairments can elicit confounding effects.

- Animal fluency (language and executive functions)

(Wall et al., 2017,)

Methods

Material

Domain-general tasks

- **Attention:** Attention Network Test
- **Short-term memory:** Digit and tap spans
- **Reasoning:** Raven Colored Progressive Matrices

Linguistic Tasks

Phonology

Discrimination task (words and pseudowords)

Estímulo	Palabra 1	Palabra 2	Tipo de palabra	¿Iguales?
0	edificio	edificio	word	yes
0	gimbre	nimbre	pseudoword	no
1	barro	barro	word	yes
2	gar	sar	pseudoword	no

Repetition (word-sentence)

Estímulo	Input
0	luz
0	los pies
1	bar
2	can
3	pulgón
4	carne
5	la ropa sucia
6	sonaja vendida
7	una caja muy grande
8	un cebollín muy ovado
9	Mi vecino siempre hace mucho ruido.

Linguistic Tasks

Syntax

Grammaticality Judgement Task

Estímulo	Enunciado	Gramatical
0	Las mañana en mi casa son muy complicadas.	no
0	El ordenador de mi oficina funciona muy bien.	yes
1	Durante la clase de mañana diré cosas importantes.	yes
2	El hombre tiendes la ropa mojada afuera.	no
3	La butaca rojo del cine es muy cómoda.	no
4	En la tienda grande, el patinete es rojo.	yes
5	Esta es una sartén de la casa de mi mamá.	yes
6	La cuevas cerca de la montaña son peligrosas.	no

Linguistic Tasks

Syntax

Phrase-sentence elicitation task

Number agreement

Examiner: La antorcha

Participant: las antorchas

Predicative number agreement

Examiner: Este es un anillo

Participant: Estos son unos anillos

Gender agreement

Examiner: El altavoz negro

Participant: El baston negro

altavoz

Predicative gender agreement

Examiner: La batidora es morada

Participant: La espada es morada

batidora

perseguir

Subject-verb-argument agreement

Participant: El gato persigue al raton.

bastón

espada

Linguistic Tasks

Semantics

Picture verification

Examiner: PAN?

Participant: YES

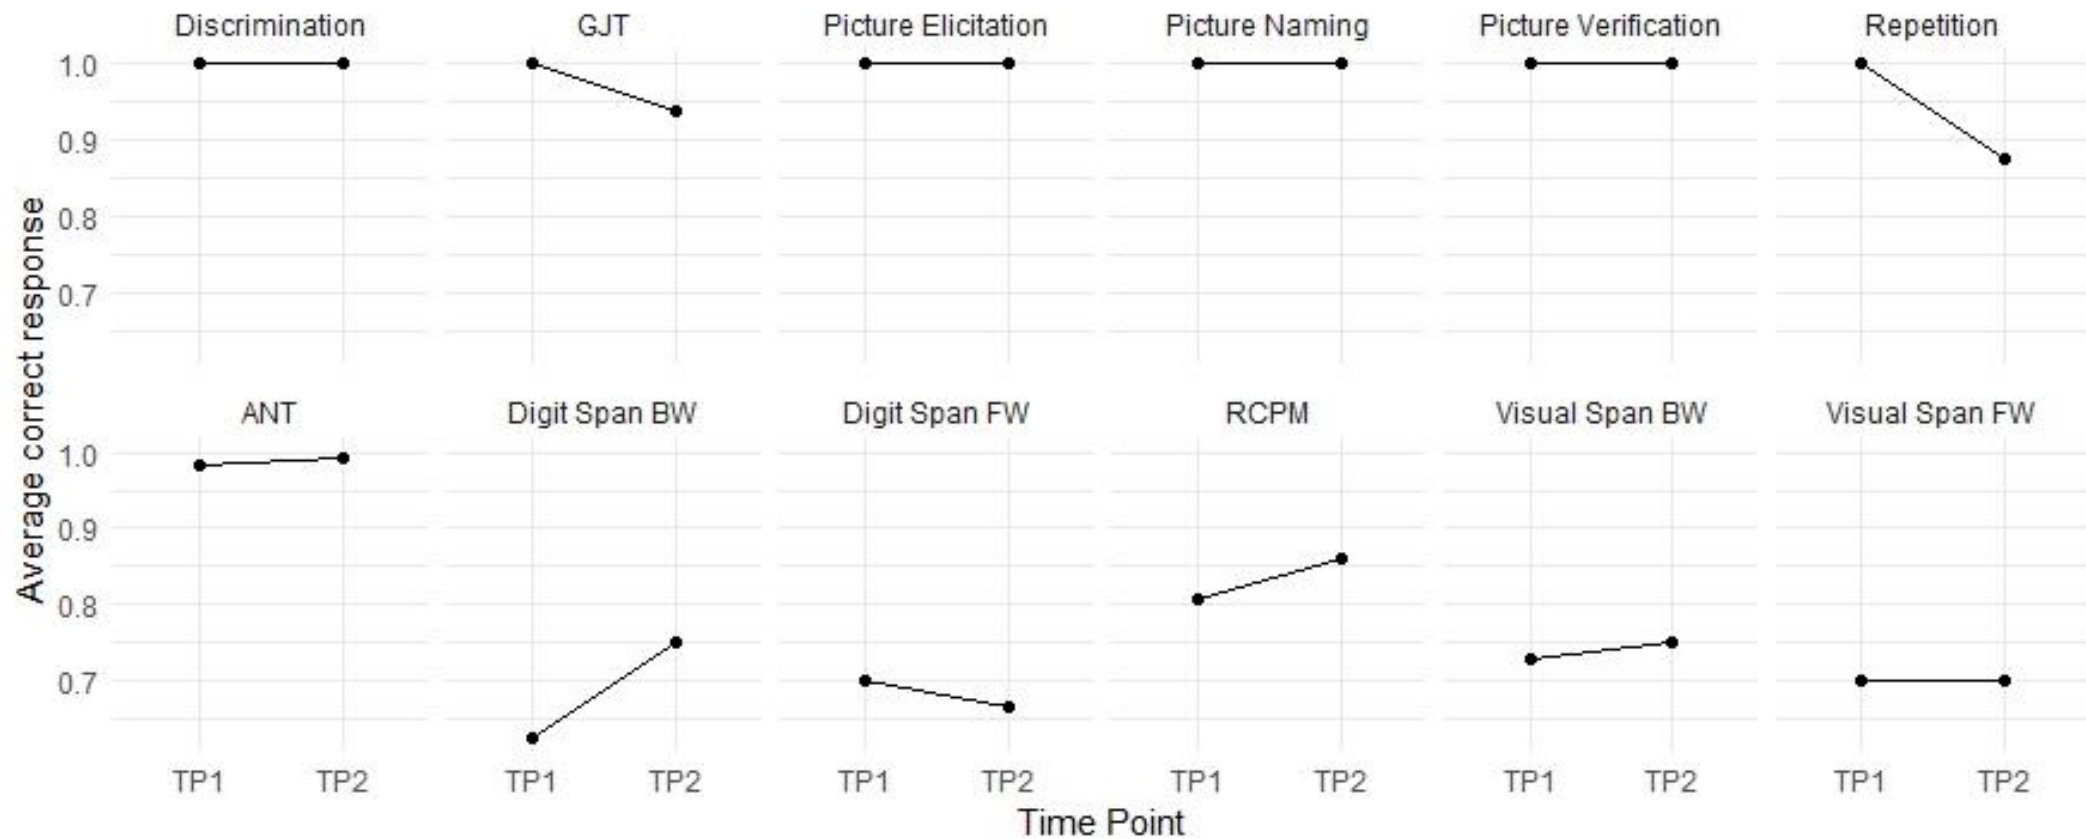

Naming task

Table 1. Information of participants included

	Patients	NBD
Age, mean years (<i>SD</i>)	63.21 (9.26)	63.20 (9.15)
Gender Female/male	4/13	4/12
Handedness <i>n</i> Right-handed Left-handed	16 1	15 1
Education, mean years (<i>SD</i>)	11.51 (2.39)	13.16 (3.36)
Localization of stroke <i>n</i> Left hemisphere Right hemisphere	8 9	NA

Left-handed participant

Models of global scores

Model	df	df_diff	Chi2	p value
Global LNG ~ 1	2			
Global LNG ~ Global DG	3	1	3.45	0.063
Global LNG ~ Global DG + Group	4	1	6.89	0.009
Global LNG ~ Global DG * Group	5	1	0.80	0.372
Global LNG ~ Global DG * Group + TP	6	1	0.63	0.428
Global LNG ~ Global DG * Group + TP * Global DG	7	1	0.13	0.720
Global LNG ~ Global DG * Group + TP * Global DG + TP * Group	8	1	1.61	0.205
Global LNG ~ Global DG * Group * TP	9	1	2.54	0.111
